    hatemolytic-ureantic syndrace, wFF-op can also be used for processing 
plasmatic or recombinantly produced wFF. The invention is useful for 
construction appression by Systems and generating transgenic animals which 
express the polypopide in vivo. The present sequence is human wFF-op
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            BACVLEPCPPYWAVGDPGPCSASCGGGLRERPVRCVEAGGSLLKTLPPARCRAGAQPAV

Ė

von Willebrand factor-cleaving enzyme, applicable in digmosis of, and supplementary therapsy for, thrombocit, thrombocytopento purpura, and for developing drugs for e.g. myocardial infarction and corebra infarction. N-PSDB: ABT32585.

The givening comprises the mains edit and coding sequence of a von Nullbarned fescor (VMF) -cleaving enzyme. The ONA and procein measurement to the internation are useful in the disapposit and researcher of the internation of the company of the c Sequence 1378 AA;

      von Willebrand factor-cleaving enzyme, applicable in diagnosis of, and
supplementary therapy for, thrombotic thrombosytopenic purpura, and for
developing drugs for e.g. wycasidial inferction and cerebral inferction
                                                                                                                                                                          The invention comprises the maino acid and coding sequence of a von 
the landermal factor (WRF)-clasving ensyme. The DNA and procise sequences the invention are useful, in the diagnosis and treatment of 
the invention are useful, in the diagnosis and treatment of 
the invention are useful, in the diagnosis and treatment of 
infarction, esembral infarction, are residenteres, placelet thrombosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          598 GPLQEDADIQVYRRYGEEYGNLTRPDITFTYFQPKPRQAWWAAVRGPCSVSCGAGLRWV

CURA-) CURAGEN CORP.

Ē Mattheway of Managaria and Man

WPI; 2003-111987/10. N-PSDB, ACP16980

New WOVY polypaptides and polymuclectides useful for treating or preventing e.g. cardiosypathy, atherosclarosis hypertension, congenital hear defects, acris series acras septal defect, or attiowentricular canal defect.

Claim 1, Page 173; 491pp; English.

Processes to Activation encode the human openic-coupled exception (OCCE)
processes designated NOW processes with ARREAD to ARREAD. The
NOW sequences can have opposited, called an arread to the control of the coupled of the coupled

Sequence 984 AA;

Gaps 29; Mismatches 108; Indels 256; 30.2%; Score 2340; DB 6; Length 984; 56.0%; Pred. No. 6.6e-167; 500; Conservative Best Local Similarity Matches 500; Conserv Ouery Match

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
